

PULMONOLOGY 1

Marrow SS Medicine

Dr. Shone P James

MBBS, MD, DM (Pulmonology)

A Gold Medalist from Government Medical College, Kottayam, Dr. Shone P James completed his DM in Pulmonology from Government Medical College, Kozhikode, making him one of the few pulmonologists in Kerala with such a credential. Throughout his career, he has authored numerous publications and gained expertise in diagnosing and treating respiratory diseases, with specialised skills in pulmonary procedures.

MARROW
— Super Speciality

Instructions

- The notes must be used in conjunction with the Marrow SS Medicine videos and should not be considered standalone material.

Please note:

- The information in this book has been printed based on the transcript of the Marrow SS Medicine videos.
- The information contained in this book is for educational purposes only. The content provided is not intended to substitute for professional medical advice, diagnosis or treatment.
- This book cannot be sold separately. It has been made available to only select eligible users who have an active subscription to Marrow SS Medicine videos.
- The text, images, slides, and other materials used in this book have been contributed by the faculty, who are subject matter experts. We have merely reproduced them as video transcripts in this book.
- The notes have been consciously designed in a way that is concise and revisable. To ensure this, we have intentionally added only the most relevant modules and images that are needed for you.
- Reasonable care has been taken to ensure the accuracy of the information provided in this book. Neither the faculty nor Marrow takes any responsibility for any liability or damages resulting from applying the information provided in this book.
- This set contains notes of all main videos published in the app until Jan 2025. You can find notes for any additional videos published after this date within the app under the videos section.

LUNG ANATOMY AND APPLIED CLINICAL ASPECTS : I

----- Active space -----

Introduction

00:01:23

Right lung is bigger & heavier than left lung.

Fissures :

Deep depressions on the lung surface extending to the centre of the lung.
Lined by visceral pleura.

2 fissures on right and 1 fissure on left lung.

- Right horizontal/**minor fissure** : Between right upper and middle lobes.
- Right oblique fissure/**major fissure** : Between right middle and lower lobes.
- Left oblique fissure : Between left upper and lower lobes.
- Inferior accessory fissure : Separates median segment of lower lobe from the rest of the lobe.

Fissures of lungs

Expansile property of lungs

Applied aspect :

- Auscultation over infrascapular region and back : To examine lower lung lobes/base of the lungs.
- Chest X ray PA view : Portions of lower lobes are hidden.
- To view lower lobes : Lateral view is preferred.
- During inspiration, lungs can inflate to 5-6 L or by 4-6 cm.

----- Active space -----

Pleura

00:06:10

Covering of lungs.

2 layers :

- Outer layer : Parietal pleura.
- Inner layer : visceral pleura.

Lined by squamous epithelium (mesothelium).

Pleural cavity : Contains 15-20 mL of clear pleural fluid normally.

Note : mesothelioma is a malignant tumour originating from pleura.

Parts of parietal pleura :

1. Cervical pleura.
2. Costal pleura.
3. mediastinal pleura .
4. Diaphragmatic pleura.

Normal pleural fluid :

- Volume : 15 to 20 mL.
- Total count : 1700 cells/mm³.
- Differential cell count : 75% macrophages, 23% lymphocytes, 1% mesothelial cells.
- microbiological and cytological analysis : Negative.
- Function of pleural fluid : To reduce friction.

microfiltration from capillaries → Fluid reaches pleural space → Absorbed by stoma/stomata in parietal pleura → Absorbed into lymphatics.

Pleural effusion :

Causes :

1. Increased capillary leak : Inflammation, infection.
2. Poor pleural lymphatic drainage : mediastinal adenopathy, lymphoma, carcinoma lung, pulmonary tuberculosis.

Chest x ray findings :

- Homogenous opacity.
- Blunting of costophrenic, cardiophrenic angles.
- Loss of heart/diaphragmatic borders.
- mediastinal shift opposite side.

Layers of pleura

Parts of parietal pleura

Chest x ray showing left pleural effusion

Pleural fluid analysis :

- Total count, differential count.
- Cytology.
- Nucleic acid amplification test (NAAT).
- microbiological analysis.
- Adenosine deaminase (ADA).

----- Active space -----

medical thoracoscopy :

- Direct visualisation of pleura, pleural cavity.
- Biopsy from parietal pleura for histopathology and NAAT.

Lateral wall lesions on chest x ray :

Pleural based lesion : Pregnant belly sign.

Obtuse angle with the chest wall.

Lung parenchymal lesion : Acute angle with the chest wall.

Pleural based lesion :
Pregnant belly sign**Lobes of the lung**

00:17:35

Right lung : 3 lobes (upper, middle, lower).

Left lung : 2 lobes (upper, lower).

On chest x ray, lung fields are divided into upper, middle and lower zones to describe lesions.

Right upper lobe cavity with
consolidation : Pulmonary tuberculosisIdiopathic pulmonary fibrosis : Reticular
opacities in lower and upper zones.Pseudotumour/phantom tumour :
Fluid filled within minor fissureAzygos fissure (Accessory fissure) :
Normal variant in 1-2% population

----- Active space -----

Hilum

Anatomical location :

Area through which pulmonary arteries, pulmonary veins, bronchi and lymphatics enter the lungs.

Attaches lungs to the mediastinum.

Right hilum : Pulmonary artery lies in front of the bronchus.

Left hilum : Pulmonary artery lies above bronchus (mnemonic : LAA).

Left hilum is high than right hilum : Pulmonary artery on left side is above the bronchus.

If right hilum is higher than left : Right upper lobe collapse.

Lesions of hilum :

1. Bronchial lesion : Bronchogenic carcinoma.
2. Dilated pulmonary artery : Pulmonary artery hypertension.
3. Pulmonary vein dilatation : Rare.
4. Hilar lymph node.
5. mediastinal lesion.

Golden S sign : Right upper lobe collapse.

B/L enlarged pulmonary arteries : Pulmonary artery hypertension.

Opacity in right hilum.

B/L enlarged hilum : B/L hilar lymphadenopathy in sarcoidosis.

Airways

00:37:32

----- Active space -----

Trachea divides into right and left bronchus at **carina**.

Left main bronchus is **narrower & longer** than right main bronchus.

Right main bronchus divides into :

1. Right upper lobe bronchus.
2. Intermediate bronchus : Divides into middle lobe and lower lobe bronchus.

Left main bronchus divides into :

1. Left upper lobe bronchus : Divides into upper lobe and lingular bronchus.
2. Left lower lobe bronchus. (No middle lobe bronchus on left side).

main bronchus → Lobar bronchi → Divide into segmental bronchus → Subsegmental bronchus.

- main bronchus : Primary bronchus.
- Lobar bronchus : Secondary bronchus.
- Segmental bronchus : Tertiary bronchus.

Dimensions of airways :

- Total length of trachea : 10-15 cm in adults.
- Intrathoracic portion of trachea : 6-9 cm in adults.
- Coronal diameter of trachea : 1.3-2.5 cm in adult male.
1-2.1 cm in adult female.
- Sagittal diameter of trachea : 1.3-2.7 cm in adult male.
1-2.3 cm in females.
- Left main bronchus length : 4 cm.
- Right main bronchus length : 2 cm.
- Length of right intermediate bronchus : 2 cm.

----- Active space -----

- Diameter of right main bronchus : 1.5 cm.
- Diameter of left main bronchus : 1.3 cm.
- Right main bronchus makes an angle of 25–30° with midline.
- Left main bronchus makes an angle of 45° with the midline.

Foreign body goes commonly in **right main bronchus** : wider, shorter and more in line with trachea.

Flattening of expiratory loop :
Intrathoracic obstruction of trachea.

Flattening of inspiratory loop :
Extrathoracic obstruction of trachea.

Clinical importance of flow volume curves : **Site of obstruction** can determine the **size of stent required** to relieve tracheal obstruction.

Cross sectional anatomy of airways :

Cross sectional anatomy of bronchus :

1. Smooth muscle layer : Criss cross pattern, causes bronchoconstriction on contraction.
2. Connective tissue layer : Incomplete cartilage.
Goblet cells and submucosal glands.
3. Epithelium : **Pseudostratified ciliated columnar** epithelium.

----- Active space -----

Cross sectional anatomy of bronchiole :

- No cartilage.
- No goblet cells.
- Smooth muscle layer present.

Changes in bronchioles in patients of COPD and asthma exacerbation :

- Smooth muscle hypertrophy.
- Narrow lumen.
- Excessive mucus inside lumen.
- Glandular hypertrophy.

Bronchial thermoplasty :

- For treatment of uncontrolled severe asthma.
- Target : Smooth muscle tissue volume is reduced.

mucociliary escalator :

- Protective mechanism of upper airway.
- Epithelium : Pseudostratified ciliated columnar epithelium.
- Goblet cells produce mucus layer over the ciliated epithelium.

- To and fro movement of cilia (mucociliary escalator) moves **mucus towards the pharynx**.
- Normal frequency of ciliary movement : **12-20 Hz**.
- Foreign bodies lodged in mucus layer is pushed out into the pharynx by mucociliary escalator.

Pseudostratified ciliated columnar epithelium with goblet cells

microvilli and cilia on electron microscopy

Structure of cilia :

- Peripheral microtubules :
9 doublets consisting of **microtubule A and B**.
- Central microtubules : 1 pair.
- Radial spokes connect peripheral microtubules to central microtubules.
- Peripheral doublets are connected by **nexin**.
- **Dynein** : Outer and inner dynein.
ATP producing part of the cilium.

Cross section of cilia

Primary ciliary dyskinesia : Immotile cilia syndrome.

- mutation in ciliary structures.
- Clogging of airways due to secretions → Infections.
- Sinusitis.
- Recurrent lung infections → Bronchiectasis.
- Infertility.
- 50% cases : Situs inversus.
- **Kartagener syndrome** :
 1. Triad of sinusitis.
 2. Bronchiectasis.
 3. situs inversus.
- **Young syndrome** : Kartagener's triad + infertility.

Cystic shadows in B/L lower lobe :
Bronchiectasis and situs inversus

LUNG ANATOMY AND APPLIED CLINICAL ASPECTS : II

----- Active space -----

Segments of the lung

00:00:10

Part of lung	No. Of segments	Name of segments
Right upper lobe	3	Anterior, apical and posterior.
Right middle lobe	2	medial and lateral.
Right lower lobe	5	Apical, anterior, posterior, medial and lateral.
Left upper lobe	4	Apicoposterior, anterior, superior lingula and inferior lingula.
Left lower lobe	4	Apical, anterior, posterior and lateral.

Bronchopulmonary segments :

- Basic functional anatomical unit of lung, with it's own bronchial artery, vein and lymphatic channels.
- Each segment is supplied by a segmental/tertiary bronchus along with a tertiary branch of pulmonary artery.
- Pyramidal in shape, apex directed towards hilum and base is directed towards pleural surface.

----- Active space -----

Segments of lung.

Clinical significance :

- Each segment can be **surgically resected** without affecting the function of adjacent segments.
- Certain diseases commonly affect specific segments :
 - a. Apical and posterior segments of right upper lobe : **Tuberculosis.**
 - b. Anterior segment of right upper lobe : **Lung cancer.**
 - c. Posterior basal segment of left lower lobe : **Intra-pulmonary lung sequestration.**
 - d. Posterior segment of right upper lobe and superior segment of right lower lobe in supine position : **Aspiration/lung abscess.**
 - e. Basal segments of both lower lobe can also be affected by aspiration.

TB : Apical and posterior segments of right upper lobe.

Lung abscess : Posterior segment of right upper lobe.
