

Pathology

Marrow Edition 8

MARROW

Instructions

- Notes are to be used in conjunction with Marrow videos.

Please note:

- The information in this book has been printed based on the transcript of the Marrow videos. This book has to be used in conjunction with the Marrow videos and not as a standalone material.
- The information contained in this book is for educational purposes only. The content provided is not intended to substitute for professional medical advice, diagnosis or treatment.
- This book cannot be sold separately. It has been made available to only select eligible users who have an active subscription to Marrow videos.
- The text, images, slides, and other materials used in this book have been contributed by the faculty, who are subject matter experts. We have merely reproduced them as video transcripts in this book.
- The notes have been consciously designed in a way that is concise and revisable. To ensure this, we have intentionally added only the most relevant modules and images that are needed for you.
- Reasonable care has been taken to ensure the accuracy of the information provided in this book. Neither the faculty nor Marrow takes any responsibility for any liability or damages resulting from applying the information provided in this book.

Contents

General Pathology

Cell Adaptations	1
Cell Injury	5
Cell Death	10
Intracellular Accumulations	18
Acute Inflammation	25
Chronic Inflammation	32
Mediators of Inflammation	39
Wound Healing and Tissue Repair	44
Hemodynamics	50
Neoplasia : Basics	54
Types of Carcinogenesis	59
Neoplasia : Hallmarks	64
Lab Diagnosis of Cancer	72
Tumour Diagnosis	78
Genetics : Basics and Mendelian Modes	84
Genetics : Non-Mendelian Modes and Pedigree	92
Genetics : Chromosomal Disorders	98
Genetic Disorders - Diagnosis	105
Hypersensitivity Reactions	110
Transplant Pathology	114
Immunodeficiency Disorders	119
Amyloidosis	124

Hematology

RBC : Introduction	128
Peripheral Smear Examination	136
Microcytic Hypochromic Anemia	143
Megaloblastic Anemia	151
Hemolytic Anemia : Part 1	156
Hemolytic Anemia : Part 2	167
WBC : Introduction	175
Acute Lymphoblastic Leukemia	181
Acute Myeloid Leukemia	185
Myeloid Disorders	190
Chronic Leukemia	197
Hodgkin's Lymphoma	203
Non Hodgkin's Lymphoma	207
Plasma Cell Disorders	215
Hemostasis : Part 1	220
Hemostasis : Part 2	227
Blood Banking and Transfusion Medicine	234

Cardiovascular System

Blood Vessels : Sclerosis	240
Blood Vessels : Vasculitis	246
Vascular Tumors	253
Cardiovascular System : Part 1	258
Cardiovascular System : Part 2	263

Genitourinary System

Kidney : Basics	271
Nephritic Syndromes	277
Nephrotic Syndromes	281
Renal Involvement in Systemic Diseases	286
Kidney Tumors	290
Male Genital System : Penis and Prostate	294
Male Genital System : Testis	299
Female Genital Tract : Vulva, Vagina and Cervix	305
Female Genital Tract : Uterus and Endometrium	311
Female Genital Tract : Ovaries	316

Gastrointestinal System

Esophagus	324
Stomach	329
Intestinal Disorders	336
Inflammatory Bowel Disease	341
Colorectal Polyps and Cancer	346
Liver Pathology : Part 1	352
Liver Pathology : Part 2	359

Respiratory System

Obstructive Lung Diseases	366
Restrictive Lung Diseases	373
Granulomas and Infections of Lung	377
Lung Tumors	382

Endocrine System and Breast

Thyroid : Non-Neoplastic Lesions	388
Thyroid Tumors	391
Adrenal Medulla	397
Pituitary and Parathyroid Gland	401
Breast Pathology : Part 1	406
Breast Pathology : Part 2	411

Skin and Musculoskeletal System

Dermatopathology	418
Bone and Soft Tissue Lesions	425

Nervous System

CNS : Non Neoplastic Lesions	431
CNS Tumors	436

Miscellaneous

Demonstration of Instruments	444
------------------------------	-----

CELL ADAPTATIONS

----- Active space -----

Cell Injury

00:02:20

Causes :

Hypoxia :

- m/c cause of cell injury.
- $\downarrow O_2$ to tissues.
- m/c cause : Ischemia ($\downarrow$ blood supply to tissue).
- Severity of cell injury : Ischemia ($\downarrow O_2$ & nutrients) > hypoxia ($\downarrow O_2$).
- Sensitivity to hypoxia
 - most : Neurons
 - Least : Skeletal muscle/fibroblasts

Other agents :

- Physical : Radiation.
- Chemical : Drugs.
- Infectious : Bacteria, virus, fungi.
- Immunologic : Autoimmune disorder.
- Nutritional : Vitamin deficiencies.
- Genetic factors.

Factors affecting cell injury :

- Type of cell.
- Duration of injury.
- Metabolic state of cell.
- Type of injury.

Cellular response :

HYPERTROPHY

↑ cell size (No ↑ in cell number).

mechanism :

- ↑ Synthesis of proteins.
- Occurs in **permanent/non-dividing cells** (Neurons, cardiac/skeletal muscles).

Examples :**Physiological :**

- uterine myometrium during pregnancy.
- Breast during lactation.
- Skeletal muscle in body builders (↑ work load).

Normal myometrial cells

Pathological :

- Left ventricular hypertrophy (Hypertension → ↑ work load).
- Bladder obstruction by stone → Proximal area hypertrophy.

↑ size of smooth muscle cells

Hypertrophy + hyperplasia of gravid uterus

Normal uterus

HYPERPLASIA

↑ number of cells → ↑ size of organ.
On persisting can lead to carcinoma.

mechanism :

- Growth factor induced proliferation of cells.
- Occurs in dividing cells.

Examples :**Physiological****Compensatory :**

Liver post partial hepatectomy

Hormonal :

Breast during
→ Puberty
→ Pregnancy

Note :

Examples of hypertrophy + hyperplasia :

- Breast during puberty
- uterus during pregnancy.

Pathological**Estrogen excess :**

Endometrial hyperplasia

Androgen excess :

Benign prostatic hyperplasia

----- Active space -----

ATROPHY

↓ cell size, ↓ cell number.

mechanism :

- ↓ protein synthesis.
- ↑ protein degradation.
- Autophagy.

Examples :

Physiological :

- Disappearance of notochord/thyroglossal duct.
- Involution of uterus during parturition.

Pathological :

- Senile : Ageing of organs.
- Disuse : muscular atrophy after fracture.
- Denervation atrophy : ↓ nerve supply.
- ↓ blood supply.
- Nutritional atrophy : kwashiorkor/marasmus.
- Pressure atrophy : Area surrounding tumors.

METAPLASIA

- Reversible change.
- One differentiated (mature) cell type converted into another.
- Types
 - Epithelial (Conversion of epithelium).
 - mesenchymal (Conversion of connective tissue).

Alcian blue stained goblet cells

mechanism :

- Reprogramming of stem cells.
- Risk factor : vitamin A deficiency.

----- Active space -----

Examples :**1. Squamous metaplasia in respiratory tract :**

- Pseudostratified ciliated columnar $\xrightleftharpoons[\text{Smoking cessation}]{\text{Chronic smokers}}$ Stratified squamous epithelium.
- ↑ risk of infections.

2. Barrett's esophagus/Columnar lined esophagus (ELO) :

- Stratified squamous epithelium $\xrightleftharpoons[\text{On treatment}]{\text{GERD/Risk factors}}$ Columnar epithelium.
- Histopathological remark (H&E) :
 - Intestinal metaplasia.
 - Goblet cells present.
- Risk factor for adenocarcinoma of esophagus.
- Special staining : Alcian blue/mucicarmine (Stains mucin inside goblet cells).

3. myositis ossificans : muscle → Bone.

Esophageal biopsy : Barrett's esophagus

CELL INJURY

----- Active space -----

Injurious stimulus $\rightarrow$ Cell adaptation $\xrightarrow[\text{stimulus}]{\text{Persisting}}$ Reversible cell injury $\xrightarrow[\text{stimulus}]{\text{Persisting}}$ Irreversible cell injury
(m/c: Hypoxia)

Reversible Cell Injury

00:01:10

mechanism :

Hypoxia ($\downarrow O_2$) $\rightarrow$

$\rightarrow \downarrow$ Oxidative phosphorylation

$\downarrow$ ATP synthesis

$\downarrow$ Activity of Na^+-K^+ ATPase pump

Influx of Na^+ and H_2O + Efflux of K^+

Cellular swelling: Hydropic change

(most important morphological feature):

- Organelle swelling :
 - mitochondria (m/c affected).
 - Endoplasmic reticulum.
- membrane blebs.
- myelin figures :
 - Seen in reversible < irreversible cell injury.
 - Produced d/t plasma membrane damage.
 - Composition : Phospholipids + Ca^{2+} .

$\uparrow$ Anaerobic glycolysis

Lactic acidosis

$\downarrow$ pH

Clumping of nuclear chromatin

Detachment of ribosomes from rough endoplasmic reticulum

$\downarrow$ Protein synthesis +
 $\uparrow$ Lipid synthesis

Normal cell

Reversible injury

Recovery

Reversible cell injury

Note :

mitochondria :

- most important organelle affected in :
Reversible cell injury, apoptosis.
- Calcification (Earliest appearance).

----- Active space -----

Irreversible Cell Injury

00:12:10

**MEMBRANE DYSFUNCTION****mechanism :**

Cell membrane : Loss of selective permeability → Completely permeable.

Organelles membrane :

Loss of permeability → ↑ Cytosolic Ca^{2+}

**Clinical applications :**

- ↑ Permeability → Release intracellular enzymes in circulation.
- Examples :
 1. myocardial infarction : ↑ Serum levels : CK-MB, LDH, Troponin I/T.
 2. Hepatitis : ↑ Serum enzymes : SGOT, SGPT.

MITOCHONDRIAL DYSFUNCTION

Large, flocculent, amorphous densities in mitochondria :

- Characteristic feature of irreversibility.
- Visible only on electron microscopy.

NUCLEAR CHANGES

----- Active space -----

most important light microscopic feature of irreversibility.

1. Pyknosis : Shrinkage of nuclear chromatin.
2. Karyorrhexis : Fragmentation of nuclear chromatin.
3. Karyolysis : Dissolution of nucleus.

Free Radicals

00:23:45

molecules with ≥ 1 unpaired electrons in their outermost orbit.

unstable configuration $\rightarrow$ Release high energy $\rightarrow$ Damage cells.

Examples :

- $\text{OH}^\cdot$ (Hydroxyl) : most potent.
- $\text{O}_2^\cdot$ (Superoxide).
- H_2O_2 (Hydrogen peroxide).
- ONOO^- (Peroxynitrite) : Phagocytosis in O_2 -dependent killing pathway.

Role of free radical injury :

- Ageing (mx : $\uparrow$ use of antioxidants).
- Neurodegenerative disease : Alzheimer's disease.
- Cancer.
- Reperfusion injury.

Production and effects :

SOD : Superoxide Dismutase

Trace elements producing free radicals : Fe, Cu.

----- Active space -----

Fenton's Reaction : Fe^{2+} involved in production of free radicals (FR).

- $\downarrow \text{Fe}^{2+}$ in body d/t :
 - $\text{Fe}^{3+} \gg \text{Fe}^{2+}$ in vivo.
 - Presence of binding proteins : Transferrin (For Fe)/Ceruloplasmin (For Cu)

↓
↑ Bound form (Limit availability for FR production).

Protective mechanisms against free radicals :

Exogenous/endogenous.

Antioxidants & Targets :

		Location	Free radical inactivated
Superoxide Dismutase (SOD)	Cu-Zn SOD (SOD 1)	Cytoplasm	O_a^-
	Mn-SOD (SOD 2)	mitochondria	
Catalase		Peroxisomes	H_2O_2
Glutathione peroxidase		• Cytoplasm • mitochondria	• OH^- • H_2O_2

- Importance of SOD :
 - Protects brain from free radical injury.
 - mutation of SOD-1 → Amyotrophic Lateral Sclerosis.

Misfolded Proteins

00:35:35

Endoplasmic Reticulum (ER) : Site of protein

- Synthesis.
- Folding : Assisted by chaperones.

mechanism :

----- Active space -----

Clinical application :

Disease	Affected protein
Cystic fibrosis	CFTR
Familial hypercholesterolemia	LDL-receptor
Tay Sachs disease	Hexosaminidase α -subunit
Creutzfeldt Jakob disease	Prion
α -1 Antitrypsin deficiency	α -1 Antitrypsin
Alzheimer's disease	A β

----- Active space -----

CELL DEATH

mechanisms of cell death :

- Necrosis.
- Necroptosis.
- Pyroptosis.
- Ferroptosis.
- Apoptosis.
- Autophagy.

Necrosis

00:01:45

- Accidental death of multiple cells : **Always pathological.**

MECHANISM

Kidney biopsy : Necrosis on HPE

MORPHOLOGY

On HPE :

1. Densely eosinophilic cells : D/t loss of cytoplasmic RNA.
2. more glassy/shiny appearance : D/t loss of glycogen.
3. moth-eaten appearance : D/t digestion of organelles by lysosomes.

TYPES

Coagulative vs liquefactive necrosis :

----- Active space -----

	Coagulative necrosis	Liquefactive necrosis
Occurrence	m/c type of necrosis.	AKA colliquative necrosis
morphology	Cell outlines are preserved	Cell outlines not preserved
mechanism	Denaturation of protein	Enzymatic digestion of cells
Examples	• Infarct of all solid organs except brain : - Heart (m/c affected) - Liver - Kidney - Spleen • Burns • Dry gangrene • Zenker's degeneration (In typhoid fever) : - Affects skeletal muscle (Rectus abdominis).	• Brain • Fungal infection • Wet gangrene • Abscess
Appearance	 Infarct	 Liquid appearance

Caseous Necrosis :

Intermediate form of coagulative and liquefactive necrosis.

morphology : Cheese-like appearance.

Examples :

- **Tuberculosis** : Caseating granuloma.
- Fungal infections : Histoplasmosis, blastomycosis.

Gross specimen of lung

Fat necrosis :

Types	Examples
Traumatic	Breast
Enzymatic	• Omentum • Pancreas • mesentery

D/D : Breast cancer.

morphology : Chalky white deposits.

Chalky white
Deposits

Gross specimen of intestine

----- Active space -----

Fibrinoid necrosis :

morphology : Fibrin like (Pink coloured).

Pathology : Type II, III hypersensitivity reactions (HSN).

D/t immune complex deposition.

• Examples :

- **Aschoff nodules** : Pathognomic of rheumatic heart disease.
- Polyarteritis Nodosa (PAN) : Type II HSN.
- malignant Hypertension (HTN leading to organ damage) : **Onion skin appearance.**

Fibrinoid necrosis ←

RBCs in lumen ←

Biopsy of blood vessel

Gangrenous necrosis :

Examples : Limb ischemia.

Types	Example
Dry gangrene	Coagulative necrosis
Wet gangrene	Liquefactive necrosis

Gangrenous necrosis

Apoptosis

00:24:55

- **Genetically programmed** death of a single cell (suicide of cell).
- Organism used for most of apoptotic studies : **Caenorhabditis elegans** (Nematode).
- "Apoptosis" : Falling off.

Occurrence :

a) On completion of function of cell.

b) Damage of cell beyond repair.

EXAMPLES

Physiological :

- Organogenesis/embryogenesis : Formation of fingers in limbs.
- Parturition.
- Endometrial shedding during menstrual cycle.
- Death of harmful self-reactive lymphocytes.
- Involution of hormone-dependent tissue upon withdrawal of hormones.

Pathological factors :

- Damage to cell DNA.
- Accumulation of misfolded proteins.
- Infections : Hepatitis B (Councilman bodies).

MORPHOLOGY

MECHANISM

Phases :

1. Initiation Phase

90% : Intrinsic pathway (mitochondrial) 10% : Extrinsic pathway (Death receptor mediated)

2. Execution Phase.

3. Removal of dead cells by macrophages.

Enzymes :

1. Caspases :

- Contains caspases.
- Cleaves near aspartic acid residue.
- Types :
 - Initiator caspases : 8, 9, 10.
 - Executioner caspases : 3, 6, 7.

2. Endonuclease : Breaks down DNA to fragments.

Note :

mitochondria : most important organelle affected in :

- Apoptosis.
- Reversible cell injury.
- Calcification (Begins here).

Regulators :

1. Pro apoptotic :

- BAX.
- BAC.

2. Anti apoptotic :

BCL family :
Prevents release of cytochrome C.

- BCL-2.
- BCL-XL.
- MCL-1.

3. Stress sensors (Regulated initiators) :

- Bim.
- BID.
- BAD.
- Puma.
- NOXA.

----- Active space -----

Intrinsic pathway :

In mitochondria (most important organelle affected).

Normal mitochondria :

Upon noxious stimuli :

Stimulus for cell death (DNA damage/misfolded protein)

Activate

Caspase 9

Activates

Execution phase

Caspase 3, 6, 7

Apoptosis

Extrinsic pathway :

Death Receptors : FAS, TNF

FAS + FAS Ligand

Four death domains conglomerate

FADD

FAS Associated Death Domain

Pro-caspase 8

Activates

Caspase 8

Activates

Removal of dead cells by macrophages :

Phosphatidyl serine present inside inner membrane

Phosphatidyl serine flip (onto outer membrane)

Binding of Annexin V

Recognised by macrophages
