Marrow Edition 8

MARROW

## **Instructions**

- Notes are to be used in conjunction with Marrow videos.

## **Please note:**

- The information in this book has been printed based on the transcript of the Marrow videos. This book has to be used in conjunction with the Marrow videos and not as a standalone material.
- The information contained in this book is for educational purposes only. The content provided is not intended to substitute for professional medical advice, diagnosis or treatment.
- This book cannot be sold separately. It has been made available to only select eligible users who have an active subscription to Marrow videos.
- The text, images, slides, and other materials used in this book have been contributed by the faculty, who are subject matter experts. We have merely reproduced them as video transcripts in this book.
- The notes have been consciously designed in a way that is concise and revisable. To ensure this, we have intentionally added only the most relevant modules and images that are needed for you.
- Reasonable care has been taken to ensure the accuracy of the information provided in this book. Neither the faculty nor Marrow takes any responsibility for any liability or damages resulting from applying the information provided in this book.

Regulation of Body Temperature	262

# HOMEOSTASIS

----- Active space -----

## Introduction

00:00:48

Homeostasis is the concept of **constancy**.

Central theme for bodily function.

Disturbance in homeostasis.

Disease.

Claude Bernard :

Coined the term **milieu interior** (Internal environment).

Walter Cannon :

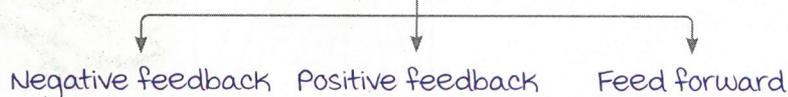

Coined the term homeostasis.

## Control systems of homeostasis

00:05:48

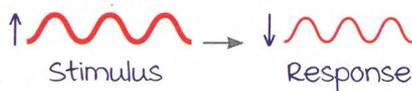

mechanisms of the body to maintain homeostasis.

Control systems

### Negative feedback :

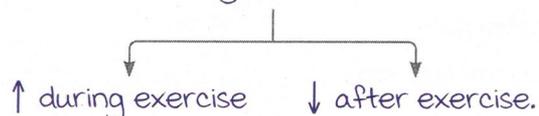

↑ in stimulus → ↓ parameters

Eg :

1. **Baroreflex** :

Changes in BP

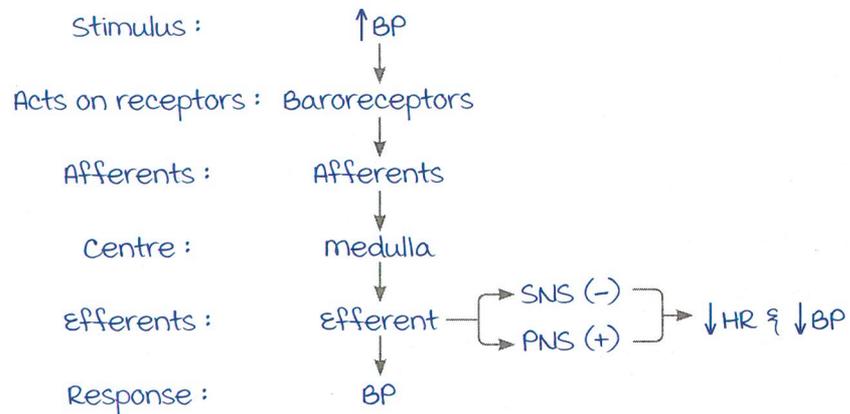

2. Endocrine hormone regulation (99%).

3. Gastric acid secretion.

----- Active space -----

Components of -ve feedback :

SNS : Sympathetic nervous system.

PNS : Parasympathetic nervous system.

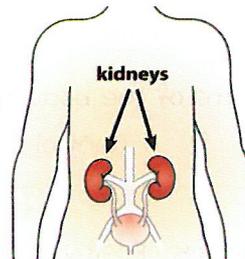

Assessment of effectiveness of -ve feedback :

$$\text{Gain (G)} = \frac{\text{Correction by the system (C)}}{\text{Error remaining (E)}}$$

Infinite feedback gain :

When error becomes zero  $G = \frac{C}{0} = \infty$ 

Gain = Infinity

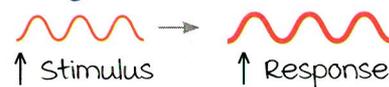

Eg :

Kidneys always correct blood pressure back to normal.

In HTN → Kidneys are affected → BP never comes back to normal.

Positive feedback :

- $\uparrow$  in initiating stimulus → Further  $\uparrow$  in response.

- Amplification/cascade of reactions.
- AKA vicious cycle (destabilizes our system).

Eg : CLAPS (mnemonic).

a) Coagulation cascade.

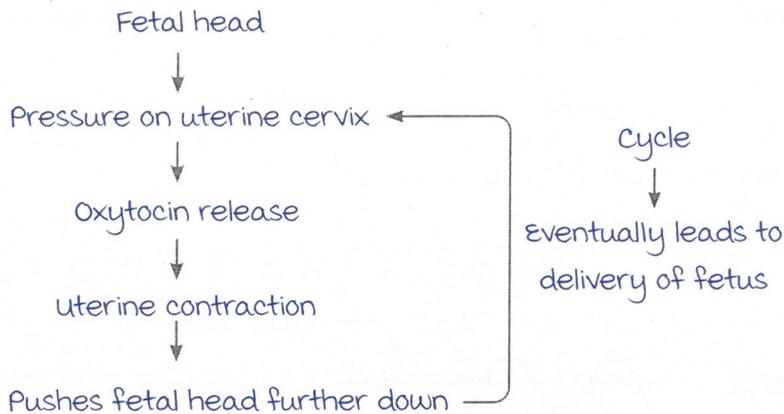

b) LH surge : Only exception for true feedback in endocrine hormone regulation.

c) Action potential.

d) Parturition (Normal delivery) :

AKA Ferguson reflex.

----- Active space -----

e) Shock :

Hemorrhagic shock (Eg : RTA) → Irreversible shock → Death (+ve feedback).

**Feedforward control system :**

Core theme : Anticipatory control system.

Body responds anticipating a stimulus (No actual stimulus).

Eg :

a) Anticipatory tachycardia &amp; tachypnea : ↑RR and ↑HR before exercise.

b) Anticipatory motor control :

- Centre : Cerebellum
- Person driving on a highway → Applies breaks on seeing a cow (Anticipates danger).

c) Anticipatory regulation of core body temperature :

- Skin temperature → Shell temperature.
- Body organ temperature → Core temperature.

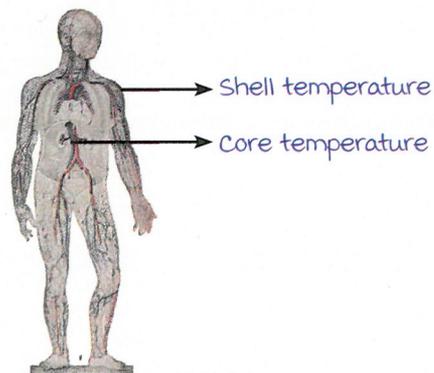

Cold environment.

↓ shell temperature.

Hypothalamus anticipates ↓ core temperature.

Corrective measures.

maintanance of core temperature.

## Properties of Homeostasis

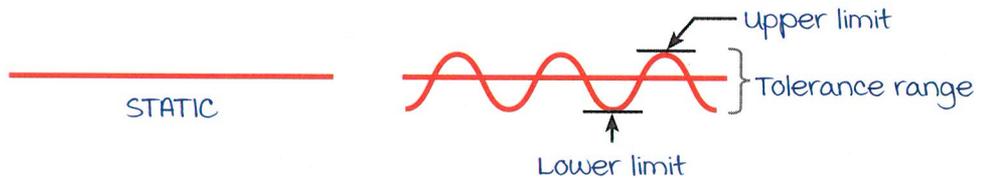

Dynamic constancy :

AKA **dynamic equilibrium**.

Homeostatic control systems maintain a "**range of values**"

Eg : Normal HR = 60-100bpm.

Normal RR = 12-18bpm.

Prioritization of parameters :

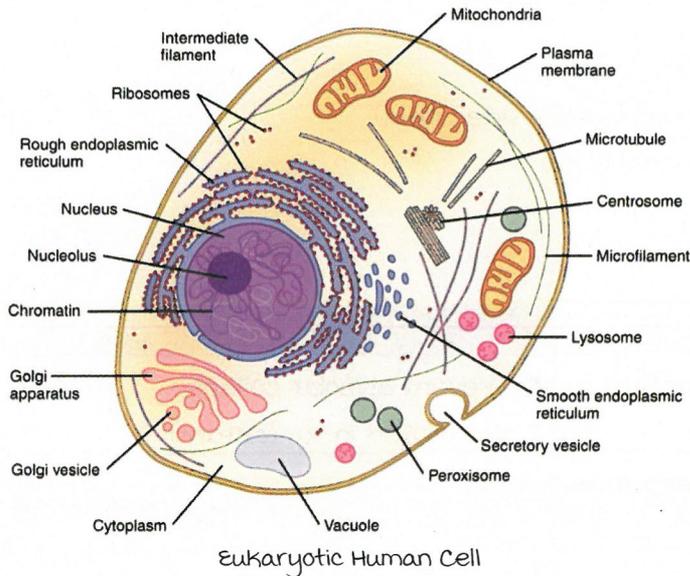

- Priority of order of correction of parameters :  

**pH** > BP > Temperature.
- pH changes are given more priority : As they affect the activity of enzymes  
 → Death.

# CELLULAR PHYSIOLOGY

----- Active space -----

Cell is the fundamental unit of all living organisms.

## Cell Membrane

00:01:13

AKA plasma membrane.

### FUNCTION

It is an outer barrier with selective permeability in cell.

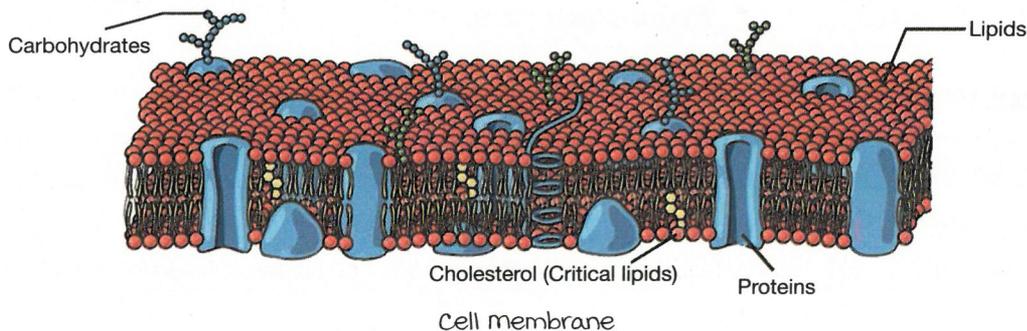

### STRUCTURE

Fluid mosaic model of cell membrane. Proposed by Singer and Nicolson.

### COMPOSITION

macromolecules :

1. Proteins (55%) : Arranged in mosaic pattern in cell membrane.
2. Lipids (40%) : Responsible for fluidity of cell membrane.
3. Carbohydrates (5%).

----- Active space -----

**Lipids**

00:04:40

**INTRODUCTION :****Structure :**

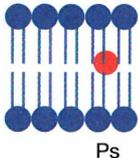

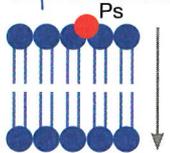

- Bilayer : Outer and Inner lipids.
- Asymmetry : Arranged specifically either on inner or outer side.

**Types :**

- Phospholipids ( $\text{PO}_4^{3-}$  group).
- Glycolipids (Carbohydrate side chain).
- Cholesterol (Critical lipid).

**PHOSPHOLIPIDS :**

major lipid.

Types	Site	Significance
Phosphatidyl choline (Pc) AKA lecithin	Lungs : Surfactant	<ul style="list-style-type: none"> <li>• Prevent alveolar collapse.</li> <li>• major lipid in surfactant.</li> </ul>
Sphingomyelin	<ul style="list-style-type: none"> <li>• Nerve cell membrane.</li> <li>• Surfactant.</li> </ul>	minor lipid in surfactant
Phosphatidylinositol (IP3)	Endocrine cells	<ul style="list-style-type: none"> <li>• Part of second messenger system (<math>\text{IP}_3 \rightarrow \text{DAG} \rightarrow \text{Ca}^{2+}</math>)</li> </ul>
Phosphatidylserine (Ps)	Inner surface of cell membrane in all cells 	If expressed on outer surface.  <ul style="list-style-type: none"> <li>• Apoptosis (Programmed cell death).</li> <li>• Detected by Annexin V : Binds &amp; forms complex with Ps. (Annexin V staining).</li> </ul>
Cardiolipin (CL)	Heart : mitochondria	In syphilis : Serum anti-CL antibody + (Detected by VDRL test)

Note :

$\frac{\text{L (Lecithin)}}{\text{S (Sphingomyelin)}}$  ratio :
 

- To assess fetal lung maturity.
- mature lung :  $\geq 2$ .

**GLYCOLIPIDS :**

Types	Site	Significance
Cerebrosides	CNS	-
Gangliosides	GIT	Gm-1 gangliosides : Receptors for cholera toxin-Fragment B.

**CHOLESTEROL :**

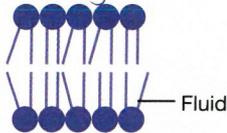

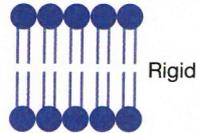

----- Active space -----

Site : Cell membrane of skin.

**Significance :**

- Precursor of Vit.D.
- 7-dehydrocholesterol  $\xrightarrow[\text{(Skin)}]{\text{Sunlight}}$  Vit.D
- **Fluidity buffer** : maintains membrane fluidity in optimal range.

**MEMBRANE FLUIDITY :**Lubricative property of lipid  $\rightarrow$  maintain fluidity of membrane  $\rightarrow$  Allows mobility.**Characteristics of Fluidity :**

	Increased Fluidity	Decreased Fluidity
Effect on health	Good	Bad
Type of fatty acids	unsaturated (Essential)	Saturated (Trans)
Examples	<ul style="list-style-type: none"> <li>• Linoleic acid.</li> <li>• Linolenic acid.</li> <li>• Arachidonic acid.</li> <li>• Omega-3 fatty acids : Abundant in fish.</li> </ul> 	<ul style="list-style-type: none"> <li>• Stearic acid.</li> <li>• Palmitic acid : (Abundant in junk food)</li> </ul> 

**Proteins**

00:24:00

**Classification based on location in cell membrane :**

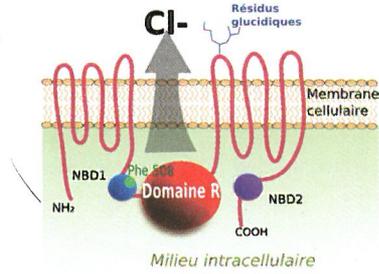

1. Transmembrane proteins/integral membrane proteins : Present throughout.
2. Peripheral proteins : Present peripherally.
3. Lipid-anchored proteins : Requires lipid for attachment.

**TRANSMEMBRANE PROTEINS (INTEGRAL MEMBRANE PROTEIN) :**

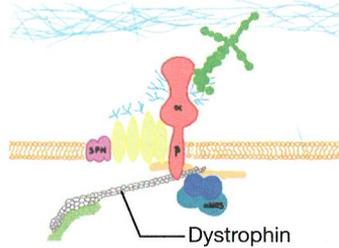

most important.

Functions	Examples
Hormone receptors (m/c)	GPCR (G-protein coupled receptors).
Pump channels	$\text{Na}^+ - \text{K}^+$ ATPase
Ion channels	<ul style="list-style-type: none"> <li>• <math>\text{Cl}^-</math> channel (CFTR). (Cystic fibrosis transmembrane conductance regulator.)</li> <li>• In cystic fibrosis <math>\rightarrow</math> CFTR mutation (+).</li> </ul>

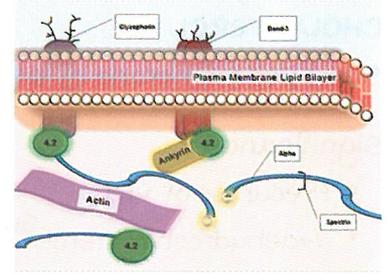

----- Active space -----

Transmembrane protein :  
Cl<sup>-</sup> channel (CFTR)

Peripheral protein

**PERIPHERAL PROTEINS :**

Functions :

1. Support shape of cell :

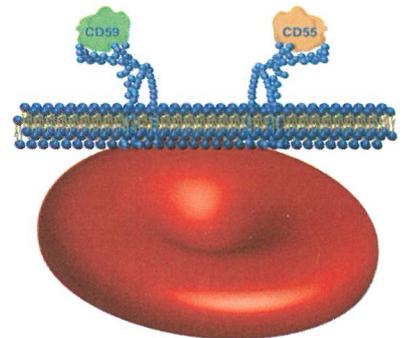

Cell	Protein	Diseases due to mutations
RBC (Biconcave disc)	Spectrin	Elliptocytosis
	Ankyrin	Spherocytosis
Skeletal muscle	Dystrophin	<ul style="list-style-type: none"> <li>Duchenne muscular Dystrophy (DMD).</li> <li>muscular weakness. Typical presentation.</li> <li>Gower's sign : Climb on own body to stand up (knee → Hip → Stand).</li> <li>Respiratory paralysis (Weakness of diaphragm) → Death.</li> </ul>

2. Cell surface receptors.

**LIPID ANCHORED PROTEINS :**

In Rbc :

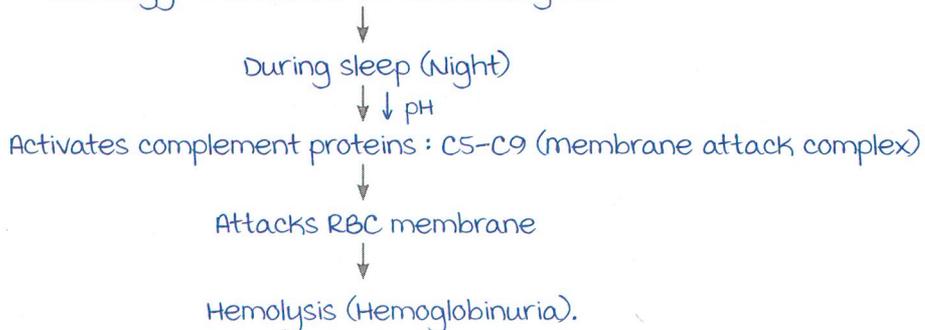

- PIGA (Phosphatidylinositol Glycan-A) gene synthesises proteins :
  - CD55 (Decay accelerating factor).
  - CD59 (membrane inhibitor of reactive lysis).
  - C8 binding protein.
- Proteins bind to lipid : **Phosphatidylinositol**.
  - Significance :
  - Normal gene : Prevent hemolysis.
  - mutated gene : Paroxysmal Nocturnal Hemoglobinuria.

Lipid anchored proteins in RBC.

**Paroxysmal Nocturnal Hemoglobinuria**

Pathology : mutated or absent PIGA gene.

Treatment :

----- Active space -----

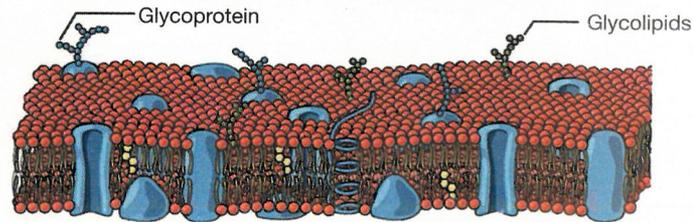

- Anti C5 monoclonal antibody : Supportive.
  - Eculizumab.
  - Ravulizumab (Long acting).
- Hematopoietic stem cell transplant : Definitive.

## Carbohydrates

00:41:30

### CLASSIFICATIONS :

1. **Glycoprotein** : Attached to proteins.
2. **Glycolipids** : Attached to lipids.

### SIGNIFICANCE :

Glycolipids on RBC membrane : **Determine blood groups.**

		Blood Type			
		A	B	AB	O
Red Blood Cell Type					

Note :

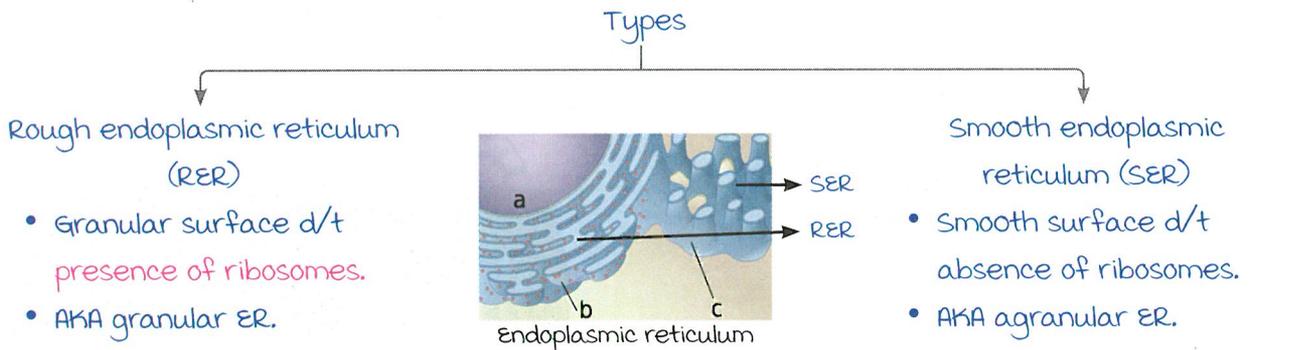

- membrane with highest protein : Inner mitochondrial membrane.
- In nerve cell membrane (myelin) : **Lipid (80%) : Protein (20%)**.
- Repair of damaged cell membrane is by resealing of lipid bilayer.
- Deficiency of lecithin in pre-term baby : **Hyaline Membrane Disease**.

----- Active space -----

# CELL ORGANELLES

## Endoplasmic Reticulum

00:00:30

### ROUGH ENDOPLASMIC RETICULUM :

#### Functions :

- Protein synthesis/translation.
- Folding of proteins : Using chaperones/heat shock proteins (HSP).
- Degradation of mis folded proteins & quality control of proteins by unfolded protein response or ER stress response.

↑ ↑ misfolded proteins → ER → 1. Halts protein synthesis.

2. Endoplasmic reticulum associated degradation (ERAD).

#### ERAD :

misfolded proteins are tagged to **ubiquitin** (kiss of death)

↓  
Protein-ubiquitin complex

↓  
moves to **proteasome** (Graveyard of the cell)

↓  
Degradation.

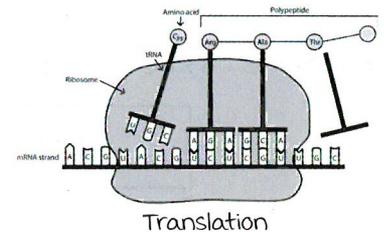

Applied aspect : misfolded protein diseases.

1. **Alzheimer's disease** : more common.

- Due to accumulation of misfolded **AB amyloid protein**.

2. Prion disease :

- PrP<sup>c</sup> (Normal protein in CNS) → PrP<sup>sc</sup> (Prion protein : misfolded).
- Eg : Creutzfeldt Jakob disease (Very fatal).

## SMOOTH ENDOPLASMIC RETICULUM :

### Functions :

#### 1. Synthesis of steroid hormones :

- Adrenal cortex : Aldosterone, cortisol.
- Testis : Testosterone.
- Ovary : Estrogen.

#### 2. Storage of $\text{Ca}^{2+}$ :

- SER of skeletal muscle stores  $\text{Ca}^{2+}$  (Sarcoplasmic reticulum).

#### 3. Drug detoxification (Xenobiosis) :

- Major site : Liver SER.
- Enzyme : **Cytochrome P450 (CYP450)**.

----- Active space -----

## Golgi Apparatus

00:14:20

Location : Close to RER.

### Functions :

#### 1. Post translational modifications:

Proteins synthesised by RER

↓  
Cis end of Golgi apparatus (GA)

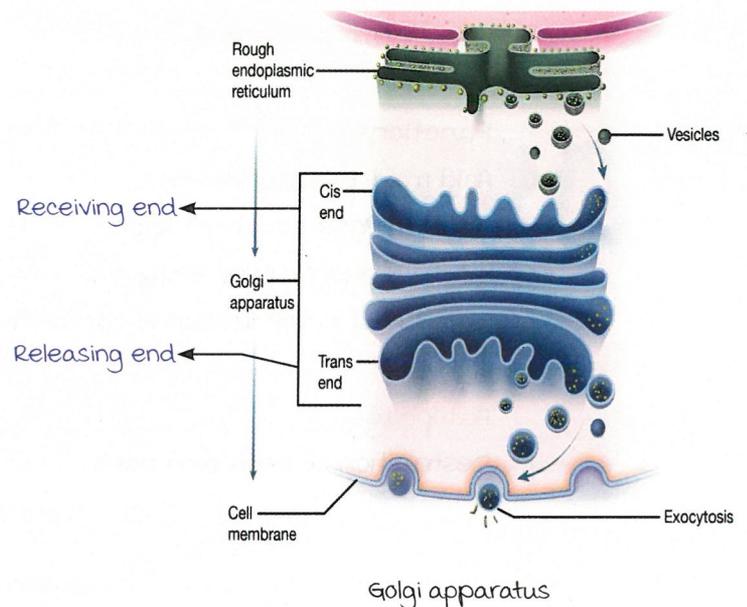

↓  
**Glycosylation** (Carbohydrate side chain is added to the protein)

↓  
Glycoprotein (↑ stability of protein)

↓  
Stored in vesicles

↓ Stimulus

Released from trans end

GA are abundant in secretory cells.

Eg : Antibody secreting plasma cells.

Goblet cells of GI tract.

#### 2. Sorting of proteins :

- GA determines where a protein is delivered.

• Eg : Protein  $\xrightarrow{\text{Phosphotransferase}}$  Protein + mannose-6-phosphate

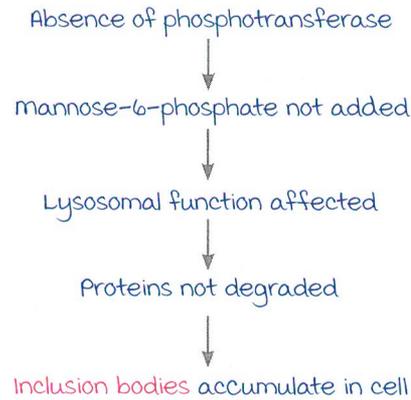

↓  
moves to lysosome

↓  
Degraded

----- Active space -----

**Applied aspect :**

I cell disease :

**Lysosomes**

00:23:30

Recycle bin of the cell.

**Functions :**

Acid mediated destruction.

- $H^+$ ATPase acid hydrolase.
- Acid hydroxylase enzyme.

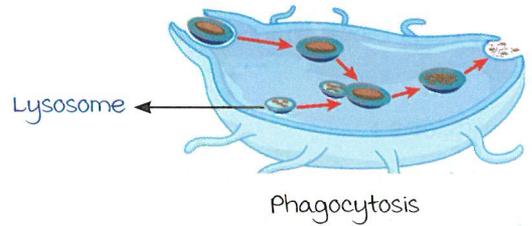

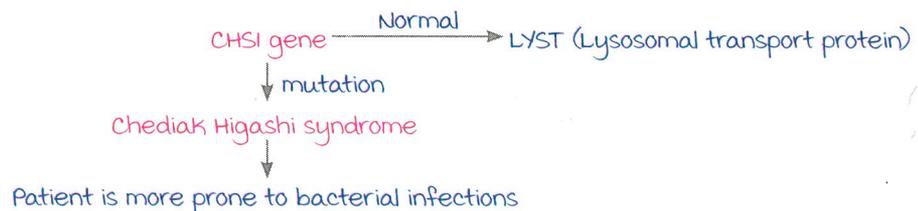

Note : Acid in the lysosome can destroy itself : Suicidal bags/residual bodies.

**Autophagy :**

Destruction of cell's own part.

**Clinical application :**

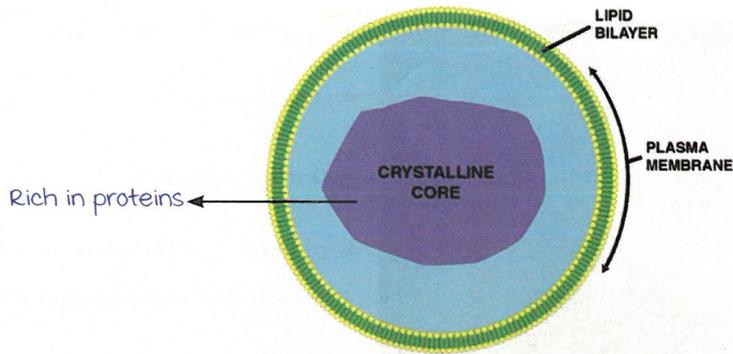

Neutrophil : High content of lysosomes.

## Peroxisomes

00:31:55

----- Active space -----

Peroxisomes/microbodies

### Function :

1. Oxidation of very long chain fatty acids (VLCFA's).
  - Generate  $H_2O_2$  (Free radical).
2. Degradation of  $H_2O_2$  : By **catalase**.
  - Pseudocatalase : Commercial/drug form of catalase.
  - Used to treat free radical mediated disorders. Eg : vitiligo.

### Enzymes produced by peroxisomes :

1. Plasminogens : Abundant in myelin sheath of nerve fibres.
2. Luciferase : Responsible for glow in fireflies.

### Peroxisomal storage disorders :

#### Zellweger syndrome :

- **PEX** gene mutation.
  - PEX codes for **peroxins** (Proteins for peroxisome synthesis).
  - Features :
    - Accumulation of VLCFA's.
    - ↓ plasmalogens.
- } Neurological impairment

#### Refsum's disease :

- PAHX gene mutation.
- Defect in phytanyl CoA  $\alpha$  hydroxylase.
- Defective oxidation of phytanic acid.

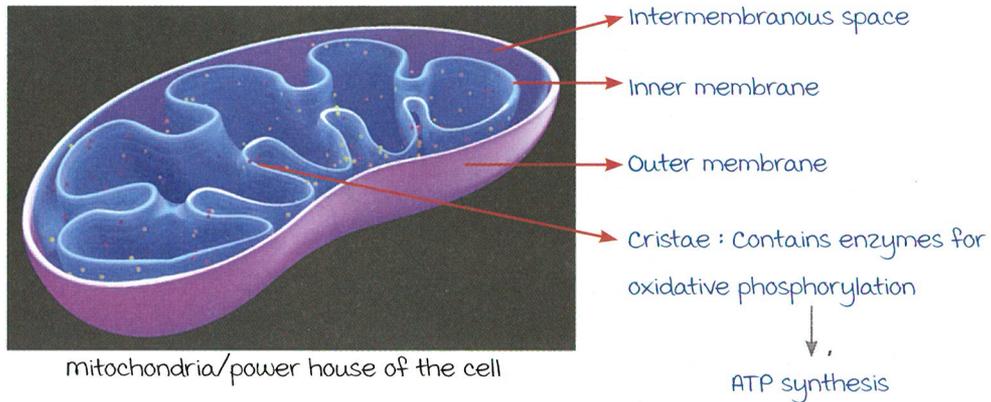

#### Adrenoleukodystrophy :

- Defect in **transport proteins**.
- $\uparrow\uparrow$  VLCFA's  $\rightarrow$  Neurological impairment.

----- Active space -----

## Mitochondria

00:40:06

### Mitochondrial DNA :

- mitochondria has its **own DNA** (Endosymbiotic theory).
- Source : Ovum → Inheritance is always **maternal**.
- ds DNA with **16500** base pairs.
- **10 times** more prone for mutation than nuclear DNA.
  - Repair of mutations in mitochondrial DNA is ineffective.
- Cannot function without nuclear DNA (To produce enzymes for ATP synthesis).

### mitochondrial disorders :

Affects organs with high metabolic requirements :

Features :

- Skeletal muscles : Contraction & relaxation is affected.
- CNS : Stroke like symptoms.
- GI tract is affected.
- ↑ susceptibility to infection.
- Lactic acidosis is common.

Mnemonic : MELAS.

- **M**itochondrial Encephalopathy.
- **L**actic Acidosis.
- **S**troke.

## Nucleus

00:48:13
