*Updated Notes 2026*

## ONCO ANAESTHESIA

# Contents

## Basics of Oncoanaesthesia

1. Modalities for Anticancer Treatment and Perioperative Implications 1

## Rehabilitation and Enhanced Recovery

2. Prehabilitation and Role of CPET in Onco Surgery 15
3. Enhanced Recovery After Surgery (ERAS) in Oncosurgeries 30

## Head, Neck and Breast Surgeries

4. Anaesthesia for Head and Neck Cancer Surgeries 37
5. Anaesthesia for Breast Cancer Surgeries 49

## Thoracic Surgeries

6. Preoperative Assessment & Optimisation of Thoracic Surgery Patients 58
7. Anaesthesia for Pneumonectomy 74
8. Post Thoracotomy Complications 86
9. ERAS in Thoracic Surgery 101

## Hepatic, HIPEC, and Gastrointestinal Surgeries

10. Anaesthesia for Hepatic Resection 108
11. Anaesthesia for HIPEC Surgeries 119
12. Anaesthesia for Pancreatic Oncosurgeries 132
13. Anaesthesia for Oesophageal Surgeries 144

## Gynaecological and Genito-Urinary Surgeries

14. Anaesthesia for Gynaecological Oncosurgeries 156
15. Anaesthesia for Genito-Urinary Oncosurgeries 168

## **Free Flap Reconstruction Surgeries**

16. Anaesthesia for Microvascular/ Free Flap Surgeries 184

## **Paediatric Surgeries**

17. Radiation Therapy in Children 194  
18. Anaesthesia for Radiofrequency Ablation 199  
19. Anaesthesia for BMB 204  
20. Anaesthesia for Paediatric Oncosurgeries 208

## **Orthopaediac Surgeries and VATS**

21. Anaesthesia for Ortho-Onco Surgeries 218  
22. Anaesthesia for VATS Surgery 226

## **Cancer Pain Management**

23. Cancer Pain Assessment 230  
24. Cancer Pain Management 242

## **Miscellaneous Topics**

25. Anaesthetic Implications of Immunotherapy/ Newer CT Agents 253

# MODALITIES FOR ANTICANCER TREATMENT AND PERIOPERATIVE IMPLICATIONS

----- Active space -----

## Chemotherapy

00:00:40

### Overview :

Chemotherapy affects the following systems :

- Central nervous system.
- Cardiovascular system.
- Pulmonary system.
- Renal.
- Hepatic.
- Immunological system.
- Haematopoietic system.

### CNS toxicity :

- most common adverse effect (Limiting factor).
- Cumulative dose/dose intensity dependent.

### Risk factors :

- DM.
- Advanced age.
- Hereditary neuropathies.
- Previous treatment with neurotoxic agent.

### Symptoms :

1. Peripheral neuropathy : Chemotherapy induced peripheral neuropathy (CIPN).
  - Pins and needle sensation.
  - Ants crawling like sensation.
2. Central (Autonomic) neuropathy :
  - Reduced autonomic reflexes.
  - Large fluctuations in hemodynamics during post-operative period.

Symptoms usually start during treatment and stabilise after that.

Implicated agents : Vince alkaloids, platins, paclitaxel and docetaxil.

----- Active space -----

#### Central neurotoxicity :

- Encephalopathy.
- Acute cerebellar syndrome.
- Posterior reversible encephalopathy syndrome.
- Aseptic meningitis.
- Cognitive deficits.
- Hemiparesis.
- Progressive dementia.

#### Peripheral neuropathy :

- Pre-dominantly affects sensory neurons.
  - Pins and needle sensation.
  - Ants crawling like sensation.
- Autonomic dysregulation.
- **Regional anaesthesia not contraindicated** but pre-existing neurological abnormality should be documented.

#### Cardiovascular system :

- Cardiotoxicity → mechanism is not understood.
- most accepted : Chemotherapy → **Damage myocytes** → Limited repair.

#### Plethora of symptoms :

- LV dysfunction.
- Arrhythmias.
- Heart failure (HF).
- myocardial ischemia.

#### Drugs implicated (CATAPAA) :

- Cytotoxic antibiotics.
- Arsenic Trioxide.
- Taxanes.
- Anthracyclines.
- Platinum compounds.
- Alkylating agents.
- Antimetabolites.

----- Active space -----

Drug class	Effect on CVS
Cytotoxic antibiotics (Pneumonic : CBM) Bleomycin/mitomycin	Cardiomyopathy
Arsenic trioxide	QT prolongation
Taxanes (Docetaxel, Paclitaxel)	Ventricular arrhythmias Bradycardia AV Blocks
Antimetabolites : Gemcitabine, Capecitabine, 5-Fluorouracil, Tioquanine, Fluoropyrimidines	myocardial Ischemia Heart failure Atrial Fibrillation
Platinum Compounds : Carboplatin, Cisplatin, Oxaliplatin	Heart failure Atrial fibrillation (2-32% Cisplatin) Torsades de pointes (Cisplatin causes hypomagnesimia)
Anthracyclines : major group Irreversible cardiotoxicity, with incidence of 9-18%	ECG changes (Early signs) Nonspecific ST and T wave changes Decreased QRS voltage Prolongation of QT interval Supraventricular arrhythmias (Atrial Fib : 2-10%) Transient LV dysfunction Late → Decline in LVEF : Dilated cardiomyopathy
Alkylating agents : Cyclophosphamide, Ifosfamide, melphalan, Treosulphan, mitomycin C, Busulfan	myocardial Ischemia Heart failure Atrial Fibrillation

**Respiratory system :**

many CT agents :

- Bleomycin (m/c known, used for testicular tumours).
- Alkylating agents.
- Antimetabolites.
- Mitomycin C.
- Gemcitabine.
- Paclitaxel/Docetaxel.

**Bleomycin induced pulmonary toxicity :**

- m/c known pulmonary toxicity.
- Interstitial pulmonary fibrosis (ITF).
- If given concentration >400 IU/m<sup>2</sup>.
- Incidence : 5-16%.
- Life threatening.
- Lung injury within 6m.
- Lung injury progress to chronic pulmonary toxicity → ILD.
- Fractional inspired O<sub>2</sub> concentration (FIO<sub>2</sub>) kept to maintain SPO<sub>2</sub> at 88-92%.
- Symptoms :
  - Dry cough.
  - Rhales on auscultation.
- Later stages → ILD (Restrictive lung disease).

----- Active space -----

Drug class	Pulmonary toxicity
Alkylating agents (Especially mitomycin C)	<ul style="list-style-type: none"> <li>• ARDS</li> <li>• Bronchospasm</li> <li>• Interstitial pneumonitis</li> <li>• Diffuse Alveolar haemorrhage (DAH)</li> </ul>
Antimetabolites	<ul style="list-style-type: none"> <li>• Interstitial pneumonitis</li> <li>• DAH</li> <li>• Capillary leak syndrome</li> <li>• Pleural effusion</li> </ul>
Platinum compounds (Carboplatin, Cisplatin & Oxaliplatin)	Interstitial pneumonitis
Gemcitabine	<ul style="list-style-type: none"> <li>• DAH</li> <li>• Interstitial pneumonitis</li> <li>• Capillary leak syndrome</li> <li>• Non cardiogenic PE</li> <li>• Pleural effusion</li> </ul>
Taxanes (Paclitaxel, Docetaxel)	<ul style="list-style-type: none"> <li>• Interstitial pneumonitis</li> <li>• Capillary leak syndrome</li> <li>• Pulmonary toxicity occurs in days to weeks</li> </ul>

**CT induced pulmonary toxicity :**

- Course of pulmonary toxicity → weeks to months.
- Symptoms
  - Cough, dyspnoea, low grade fever.
  - Bibasal crackles.
- Investigations
  - CXR : u/L or b/L reticular markings.
  - ↓ DLCO.
  - Spirometry : ↓ TLC and FVC.

**Renal system :**

- CT agents are renally excreted.
  - Alkylating agents, antimetabolites, platins.
- Chemotherapy induced acute kidney injury (AKI).
  - AKI : Presents as proximal tubular injury.
  - Proteinuria
  - Phosphate wasting.
  - Fanconi syndrome : Hypophosphataemia, hypokalemia, glycosuria, proteinuria (HHGP).
  - magnesium wasting.

----- Active space -----

**Cisplatin induced renal toxicity :**

- Cisplatin : Notorious due to AKI.
- In HIPEC surgeries : W/O monitored carefully.
  - ↓ GFR and deranged RFT.
  - ↓ Sr magnesium (Due to ↑ magnesium wasting)/potassium/calcium.
- Dose related toxicity.
- Reversible.
- Watch for signs and symptoms of hypomagnesemia.

**CT induced renal toxicity :**

- Ifosfamide (Alkylating agent) :
  - Proximal tubular injury.
  - Fanconi syndrome.
  - Nephrogenic diabetes insipidus .
- methotrexate : Intratubular precipitation of oxalate crystals.
- mitomycin C : microangiopathic hemolytic anaemia and renal failure.

**Hepatic system :**

- CT agents are **metabolised in liver**.
- Risk : ↑ pre-existing liver dysfunction.
- Clinically :
  - usually, asymptomatic.
  - Only increase in liver enzymes.
  - Inflammatory hepatitis.
  - Cholestasis.
  - Steatosis.
  - End stage liver disease.

Drug class	Pulmonary toxicity
Alkylating agents/platinum compounds	<ul style="list-style-type: none"> <li>• Hepatic Sinusoidal injury</li> <li>• Sinusoidal obstruction syndrome</li> <li>• Centrilobular hepatocyte necrosis</li> </ul>
Antimetabolites	Steatosis : Increased risk of intraoperative blood loss and postoperative complications
Topoisomerase (Irinotecan, topotecan)	<ul style="list-style-type: none"> <li>• Increase in enzymes (Transaminases)</li> <li>• Steatosis</li> <li>• Critical Hepatocellular injury</li> </ul>
Vinca alkaloids (Vincristine)	Transient increase in transaminases

Grading of severity : WHO/ National cancer institute grading of severity for CT induced liver toxicity.

----- Active space -----

**Haematological system :**

- Alkylating agents.
- Anthracyclines.
- Antimetabolites.
- Arsenic trioxide.
- Cytotoxic antibodies.
- Platinum compounds.
- Vinca alkaloids.

**Clinical features :**

- Bone marrow suppression.
- Increased risk of thrombosis.

**Immune response and CT :**

- Affects innate & acquired immune system.
- Innate immunity : Myelosuppression → CT induced neutropenia (CIN).
  - Febrile (>38.5°C in 2 occasions) neutropenia on two occasions.
- Seen in 50% of solid tumours.
  - In haematological malignancies seen in 80% of cases.

**Pancytopenia :**

- ↓ Erythrocytes, leukocytes, & platelets.
- Perioperative period → Haemorrhage → ↓ O<sub>2</sub> Carrying capacity → Complicated by pre-existing anaemia.
- WBC (ANC) : Infection rates ↑ if ANC < 500.
- BM recovery : Take upto 6 weeks.

**Adaptive immune system (Immunosuppression) :**

- Lymphopenia.
- Depends on the CT agent used, and malignancy type.
- Alkylating agents/Protein Kinase Inhibitors : Impaired function of peripheral "T" cells.
- Platinum compounds : Enhance "T" cell activation by dendritic cells.

**CT and thrombosis :**

- Seen in cancer and neo-adjuvant CT (NACT).
- Both conditions
  - ↑ Inflammatory response (↓ Antithrombin, protein C).
  - ↑ Procoagulant response (↑ TF expression).
  - ↑ Antifibrinolytic response.
  - ↑ Pro-aggregative response.

- Increased risk of thrombosis that persists upto 6 months.
- **Extended thromboprophylaxis** for 4 weeks after surgery is required.
- There is increased perioperative risk of thrombosis.
- Patients can be on anticoagulants.
- Timing of neuraxial block : **ASRA guidelines.**

----- Active space -----

## Immunotherapy

00:34:13

### Overview :

- Cancer immunotherapies :
  - manipulate host's immune system.
  - Reactivate the antitumor immune response.
- Different immunotherapies :
  - Interferon.
  - Immune checkpoint inhibitors (ICIs).
  - Chimeric antigen receptor T cells.

### Toxicity of immunotherapy :

#### Immunotherapy (Toxicity) :

- Endocrine.
- Cardiac.
- Pulmonary.
- Hepatic.
- miscellaneous S/E : Fever, fatigue, nausea, diarrhoea, thrombocytopenia and leukopenia.

### Immune checkpoint inhibitors (ICIs) :

#### Endocrinopathies :

- Hypophysitis (inflamed pituitary gland).
- Hypothyroidism/hyperthyroidism.
- Adrenal insufficiency.
- Hypogonadism.
- Diabetes insipidus.
- Insulin dependent diabetes mellitus (IDDM).

----- Active space -----

**Cardiac toxicity of immunotherapy :**

- Cardiac toxicity (Overall < 1%).
- Myocarditis most common (1.14%).
  - ↑ Ipilimumab + Nivolumab (0.27%).
  - Nivolumab alone : 0.06%.
  - median onset time : 17 days.
- Grade : 1 (Asymptomatic).
- Grade 2 : mild
- Grade 3 : Completely symptomatic.

**Symptoms and signs :**

- Fatigue.
- Dyspnoea.
- Chest pain.

**Management :**

- Investigations : Raised BNP, troponin, ECG abnormalities.
- Treatment :
  - High dose glucocorticoids.
  - Alternatively immunosuppressants.

**Other effects :**

- Cardiac fibrosis.
- Pericarditis.
- Arrhythmias.
- Heart failure.
- Cardiomyopathy.

**Pulmonary toxicity of immunotherapy :**

- **Pneumonitis** (most common) :
  - PD-1 inhibitors : Incidence is 3-7%.
  - PDL1 : Incidence is 1.3%.
  - Life threatening.
- Symptoms of pneumonitis : Non specific symptoms.
  - Cough.
  - Chest pain.
  - Wheezing.
  - SOB.
  - Respiratory failure/hypoxemia.
- CT : Ground glass opacities with peripheral consolidations.

**Gastrointestinal toxicity of immunotherapy :**

----- Active space -----

- most common S/E.
  - Diarrhoea.
  - Gastritis.
  - Enterocolitis (most common).
- Incidence is 20-30%.

**Hepatitis (5-10%) :**

- Anti PD 1, hepatitis (5%).
- Ipilimumab + Nivolumab : 30%.
- Screening for immune hepatitis to be done before starting of therapy.
- Grade 2 hepatitis : AST/ALT > 5x.

**Monoclonal antibodies**

00:41:22

**Drugs :**

Drug class (monoclonal antibodies)	Indication
Transtuzumab (Hera/neu. inhibitor)	Breast cancer
Bevacizumab (VEGF- inhibitor)	Colorectal cancer (High chance for thrombosis)
Imatinib	GIST
Panitumumab	Colorectal cancer
Sorafenib (multikinase inhibitors)	Renal cell carcinoma
Sunitinib	Renal cell carcinoma

- Sorafenib and Sunitinib induced hypertension are usually not controlled with conventional antihypertensives.

**Systemic effects of monoclonal antibodies :**

Drug class	Toxicity
Sorafenib	Rash, diarrhoea, hand and foot syndrome
Sunitinib	Fatigue, nausea, diarrhoea, hypertension, myelosuppression, Hand and foot syndrome
Transtuzumab	Cardiac dysfunction, decrease in LVEF
Bevacizumab	Hypertension, proteinuria, bleeding, poor wound healing, visceral perforation
Imatinib	Fluid retention

----- Active space -----

Drug class	Hepatic system effects
HER - 2 inhibitors : Trastuzumab, Lapatinib	<ul style="list-style-type: none"> <li>Elevated LFTs</li> <li>Sinusoidal obstruction syndrome, hepatitis</li> </ul>
Small molecule TKIs & VEGF inhibitors : <ul style="list-style-type: none"> <li>Imatinib</li> <li>Vemurafenib</li> <li>Erlotinib</li> <li>Geftinib</li> <li>Crizotinib</li> <li>Sorafenib</li> </ul>	<ul style="list-style-type: none"> <li>Elevated LFT's</li> <li>Hepatitis</li> <li>Cholestatic Hepatitis</li> <li>Granulomatous Hepatitis</li> <li>Hepatocellular liver injury</li> <li>Acute liver failure</li> </ul>
Check -point inhibitors <ul style="list-style-type: none"> <li>Nivolumab</li> <li>Pembrolizumab</li> <li>Atezolizumab</li> <li>Darvalumab</li> </ul>	<ul style="list-style-type: none"> <li>Elevated LFTs</li> <li>Hepatitis</li> <li>Cholestatic Liver injury</li> <li>Hepatocellular Liver injury</li> </ul>

## Radiotherapy

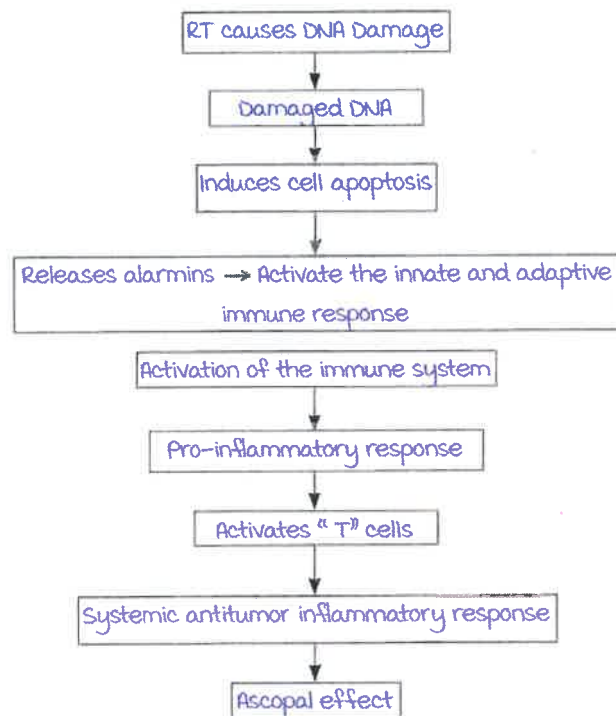

00:46:08

### Overview :

Affects the following systems :

- Immune system.
- Cardiovascular.
- Pulmonary.
- Head and neck.
- Skin.
- Mucosa.

### effect of RT on immune system :

----- Active space -----

**RT induced vascular thrombosis :**

- mild dose (5-10 Gy per fraction) → Damage is mild.
- Doses > 10 Gy → more damage → ↑ vascular permeability.
- Can lead to thrombosis.

**Cardiac toxicity of RT :**

- Thoracic RT (Hodgkin's lymphoma, CA breast).
- Cardiac toxicity : endothelial damage + Oxidative stress + Inflammation + DNA damage.

**effects :**

Can damage any cardiac component : Pericardium/myocardium/heart valves/ conduction system/coronary arteries.

- Pericardium :
  - a. Exudative pericarditis.
    - Develops early.
    - Can cause hemodynamic instability.
    - Self limiting.
  - b. Pericardial effusion.
- Conduction abnormalities :
  - Early complication.
  - Self limiting within 12 months.
  - AV block/ QTc prolongation.
  - Supraventricular arrhythmia /VT.
- Late complication : CAD.
- Restrictive cardiomyopathy due to fibrosis.

----- Active space -----

**Pulmonary toxicity of RT :**

- Lung injury is in three phases.
  - a. Acute.
  - b. Subacute.
  - c. Late.
- Acute → Hours/ days.

Acute → Chronic (2-6m post RT) → Pneumonitis.

**Risk factors :**

- mean lung dose.
- Proportion of lung dose > 20 Gy.
- underlying comorbidities.

**Findings :**

- CT scan : Asymptomatic ↑ density of tissues.
- Clinically : Suggestive of **sterile pneumonitis**.
  - Low grade fever.
  - Dyspnoea.
  - Non-productive cough.

**management :**

- Severe symptoms are to be managed with steroids.
- Sx is done in subacute phase .
  - Not at ↑ risk of PPCs.

**Late pulmonary toxicity :**

- Occurs 9-12 months.
- Irreversible re-modeling of lung parenchyma.
- Increased stiffness.
- Fibrosis and thickening.

**RT of Head & Neck :**

most important concern as it anticipated difficult airway.

----- Active space -----

**Effects :**

- Acute phase :
  - mucositis/fistulae.
  - Osteonecrosis.
  - Lack of dentition.
- Later :
  - Fibrosis of neck → ↓ Neck extension.
  - Floor of mouth/facial muscles.
  - TMJ fibrosis → Trismus.
- Glottic/ epiglottic edema.
- Swollen oral mucosa.
- Glossomegaly.
- Fibrosis & oedema → Suprahyoid region → Limited neck mobility.
- mobility of larynx compromised externally.
- Oral mucositis : Bleeds on DL scopy.
- RT administered to neck → Thyroid abnormalities.
  - Hypothyroidism should be ruled out pre-operatively.

Difficult Bmv

Limited MO

Difficult laryngoscopy and intubation

**External beam radiation therapy (EBRT) :**

- Given preoperatively in carcinoma rectum/cervix.
- Peri-operative concerns :
  - Tissues adherent/ tissue fibrosis/obstructed lymphatics.
  - ↑ Blood loss.
  - ↑ Surgical duration.
  - ↑ Surgical stress.

**Anaesthetic implications**

00:56:32

**Considerations :**

Organ system	Preoperative considerations	Intraoperative considerations
Cardiac	<ul style="list-style-type: none"> <li>• 12 lead ECG</li> <li>• QT interval</li> <li>• 2D ECHO</li> <li>• Lab tests :                             <ul style="list-style-type: none"> <li>- Plasma troponin</li> <li>- NT-pro BNP</li> </ul> </li> </ul>	<ul style="list-style-type: none"> <li>• Invasive monitoring as per patient's status</li> <li>• 5 lead ECG is to be taken</li> <li>• Stress dose glucocorticoids as needed</li> <li>• Avoid QT prolonging drugs (ketamine, Etomidate, Isoflurane, sevoflurane, desflurane, succinylcholine, 5HT3 antagonists, Antidepressants, β-Blockers, antifungals) LA (Toxic dose)</li> <li>• Avoid hypothermia</li> <li>• Fluid management</li> </ul>

----- Active space -----

Organ system	Preoperative considerations	Intraoperative Considerations
Pulmonary	<ul style="list-style-type: none"> <li>Room air SpO<sub>a</sub></li> <li>CXR</li> <li>BHT</li> <li>PFT</li> <li>DLCO</li> <li>CT scan</li> </ul>	<ul style="list-style-type: none"> <li>Prehabilitation</li> <li>Lung protective ventilation : VT of 6ml/kg, airway pressures &lt; 30cmH<sub>2</sub>O</li> <li>Stress dose glucocorticoids as needed</li> <li>Patients treated with Bleomycin : FIO<sub>2</sub> to maintain SpO<sub>2</sub> 88-92%</li> <li>Analgesia</li> <li>Avoid fluid overload</li> </ul>
Hepatic	<ul style="list-style-type: none"> <li>Lab test</li> <li>Hepatic transaminases</li> <li>INR</li> </ul>	<ul style="list-style-type: none"> <li>Avoid hepatotoxic drugs</li> </ul>

Endocrinopathy (Immunotherapy)	<ul style="list-style-type: none"> <li>TSH, Free T4</li> <li>HbA1c, ACTH, cortisol, electrolytes</li> <li>Cardiac troponins at 6 weeks after treatment</li> </ul>	<ul style="list-style-type: none"> <li>Stress dose steroids</li> <li>Balanced fluid management</li> <li>Electrolyte monitoring</li> <li>Interaction with antidepressants &amp; antiemetics</li> </ul>
Central and peripheral neuropathy	<ul style="list-style-type: none"> <li>Detailed assessment and documentation of any baseline neurological deficit</li> </ul>	<ul style="list-style-type: none"> <li>Autonomic neuropathy : Abnormal hemodynamic response to laryngoscopy &amp; intubation, surgical stress and blood loss</li> <li>Aspiration prophylaxis and RSI</li> </ul>
Haematopoietic System	<ul style="list-style-type: none"> <li>Rule out Pancytopenia</li> </ul>	<ul style="list-style-type: none"> <li>Increased risk of postoperative infections with low TLC / ANC count</li> <li>Proceed surgery if thrombocytopenia is : <ul style="list-style-type: none"> <li>Gen surgery : &gt; 50,000</li> <li>Closed cavity Sx : &gt; 1,00,000</li> <li>RA &gt; 75000-80,000</li> </ul> </li> </ul>
Head and neck RT	<ul style="list-style-type: none"> <li>Assessment and Counselling for DA</li> </ul>	<ul style="list-style-type: none"> <li>Difficult airway management</li> <li>Consider VI scope/Awake FOB</li> </ul>

Time to surgery after these therapies :

- Time to surgery (TTS) after neoadjuvant therapy.
- Weeks : Cytotoxic effects to recover.
  - Optimally 4-6 weeks.
- This window allows for prehabilitation.
